# Online Book Store Application (Flutter with Hive)

## Student Details

Name: Vatsal Rathod
Enrollment Number: 20230905040509
Course: B.Tech IT
Subject: Flutter Development

---

## 1. Introduction

The Online Book Store Application is a simple Flutter application developed to demonstrate local data storage in mobile applications. The application allows users to store, retrieve, and update book information using the Hive local database.

This project is created as part of an academic activity to understand how Flutter applications can manage data locally without using external servers or cloud databases.

The system provides basic functionality for managing books such as adding new books, viewing stored books, and updating book details.

---

## 2. Objectives

• To understand Flutter application development
• To implement local data storage using Hive database
• To demonstrate basic CRUD operations (Create, Read, Update)
• To manage book information within a mobile application

---

## 3. Technologies Used

Flutter – for building the mobile application UI and logic
Dart – programming language used by Flutter
Hive – lightweight local database for storing data
GitHub – for version control and project hosting

---

## 4. System Features

Add Book
Users can enter book details such as book title, author name, and price and store them in the local database.

View Book List
The application displays all saved books in a list format.

Update Book
Users can edit and update book information stored in the database.

Local Data Storage
All data is stored locally using the Hive database and remains saved even after the application is closed.

---

# 5. System Workflow

Step 1
The user opens the Online Book Store application.

Step 2
The user selects the option to add a new book.

Step 3
The user enters book details such as title, author name, and price.

Step 4
The data is stored locally in the Hive database.

Step 5
The user can view the list of saved books.

Step 6
If required, the user can update the book details.

Step 7
The updated data is saved again in the local database.

---

# 6. Application Architecture

The application follows a simple structure consisting of:

Main Application File (main.dart)
Initializes the Hive database and launches the application.

Model
Defines the structure of the book data.

Screens
Home Screen – main navigation page
Add Book Screen – for entering book data
Book List Screen – displays stored books

Database
Hive database is used for storing book records locally.

---

## 8. Conclusion

The Online Book Store Application demonstrates how Flutter applications can store and manage data locally using Hive. The project successfully implements basic CRUD operations and provides a simple interface for managing book records.

This project helps in understanding the integration of Flutter with local databases and the use of GitHub for project version control and collaboration.
